

## ABSTRACT

A crush resistant seamless roofing system is formed by a  
5 layer of adjacent panels having loose joints filled by expanding  
rising foam adhesive, which is trimmed to remove excess foam  
adhesive above a top plane of the roofing system. The roofing  
system thus formed is covered by a fabric layer and a coating.  
Further, the seamless roofing system is combined with a base  
10 layer, located beneath the panels, the base layer comprising  
bonded panels of a lightweight fireproofing material, resistant  
to moisture and foot traffic.
